

# Model-driven development of software for the PolarSys Rover using Papyrus-RT

Supervised by Dr. Juergen Dingel

**Presented By:**

**Harshith Vasanth Gayathri, Nicolas Hili**

**Queen's School of Computing**

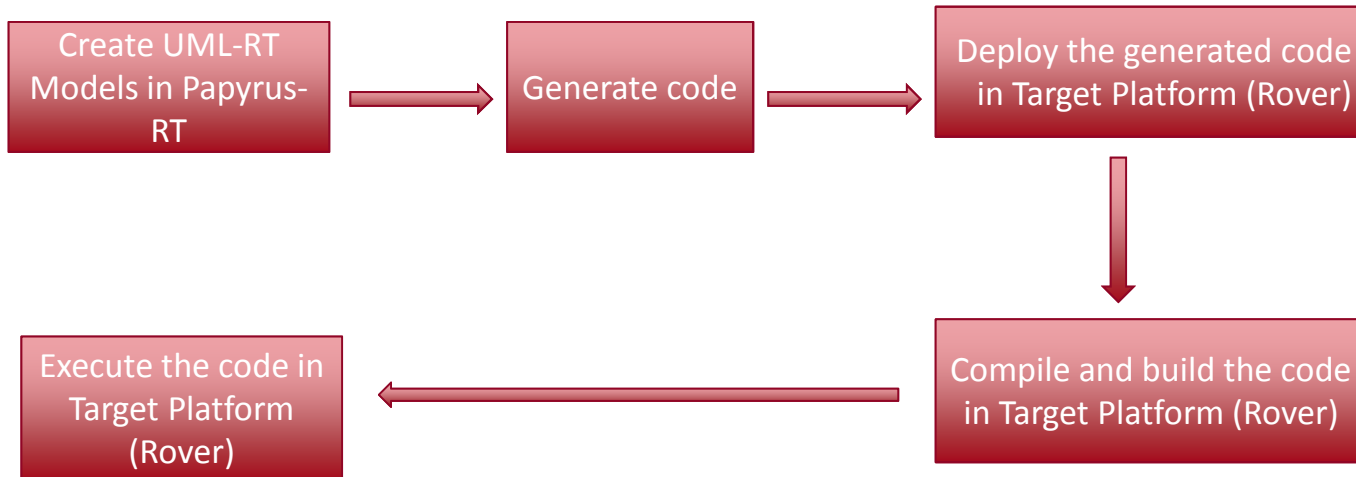

## Motivation

- As part of PolarSys Rover Project, the intension is to perform model-driven development of software for the Pololu rover.
- To get a hands-on on all the phases of the development of an embedded system.

## High-Level Design Flow

## Hardware Specs

- ▶ Pololu Dagu Rover 5 Chassis
- ▶ Raspberry Pi 3 Model B
- ▶ MC33926 Motor Driver
- ▶ HC-SR04 Ultrasonic Range sensor
- ▶ LSS05 Line Sensor
- ▶ PiCamera

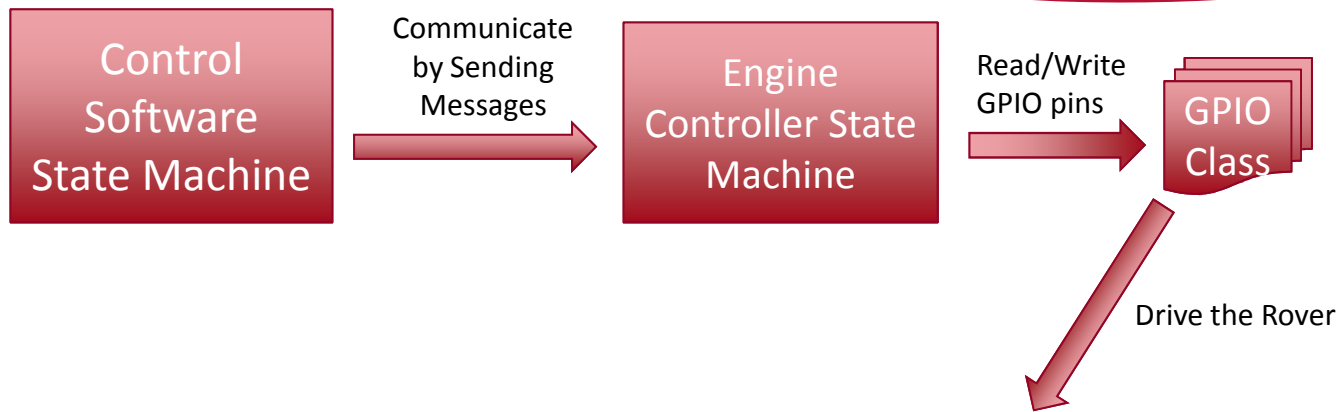

# Rover Architecture

- Application
- Rover Library
- GPIO Class
- Mapped File System
- Hardware

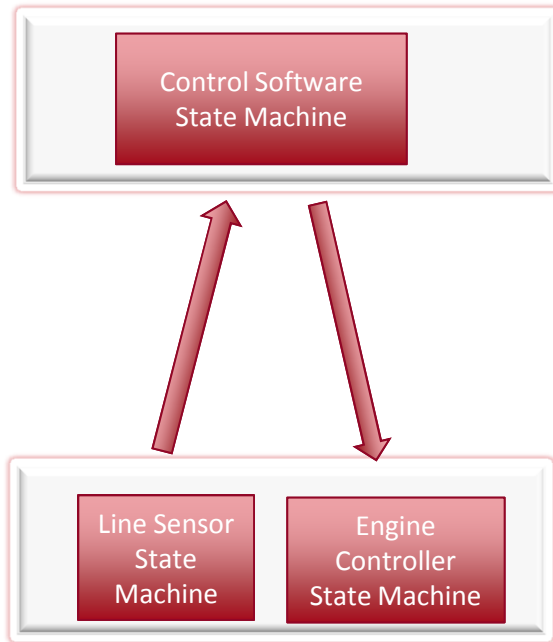

## Work Flow

## Use Case 1: Line Following

### Application

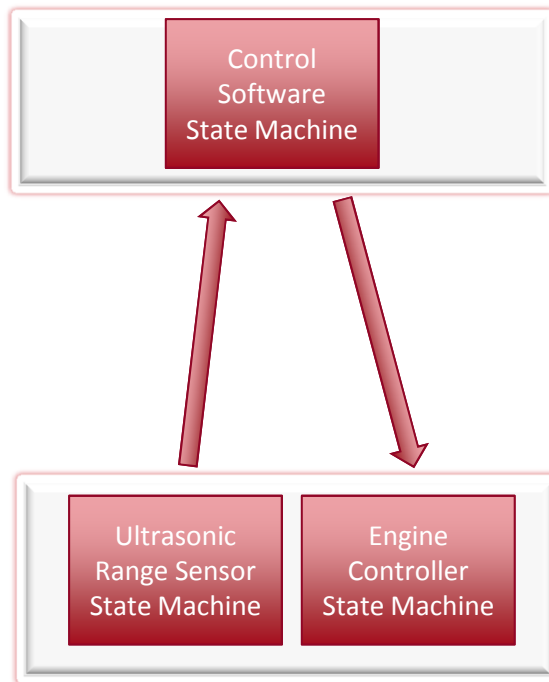

### Rover Library

## Use Case 2: Obstacle Detection

### Application

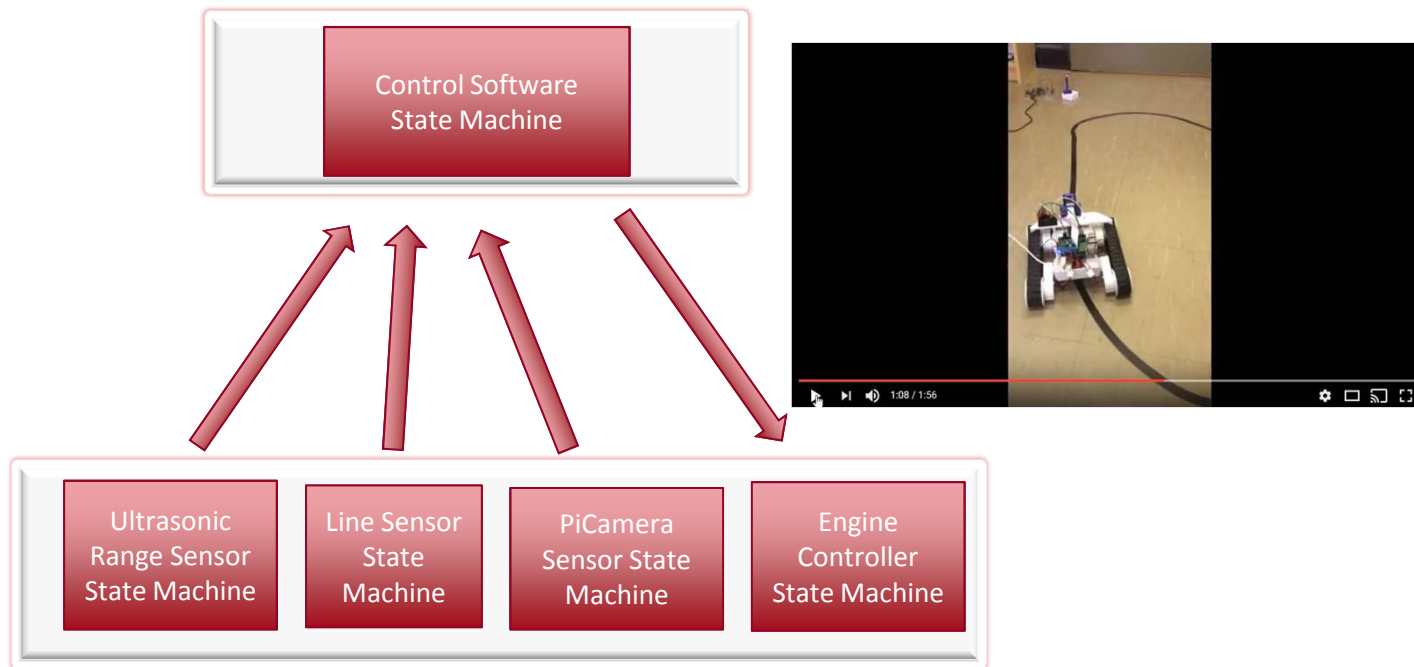

### Rover Library

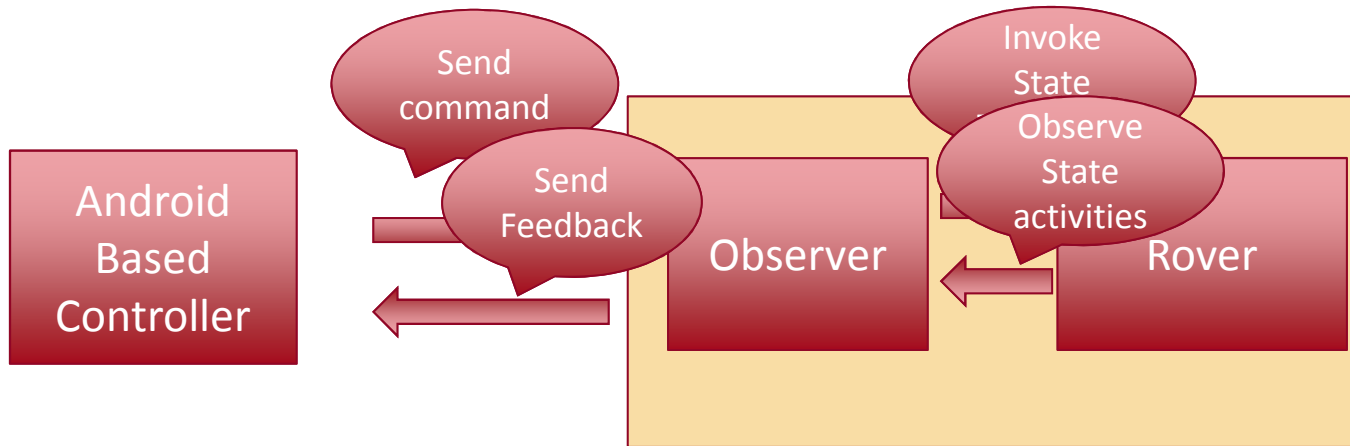

## Use Case 3: Image Recognition

### Application

### Rover Library

## Communication with External Environment

## Use Cases

Android Controller

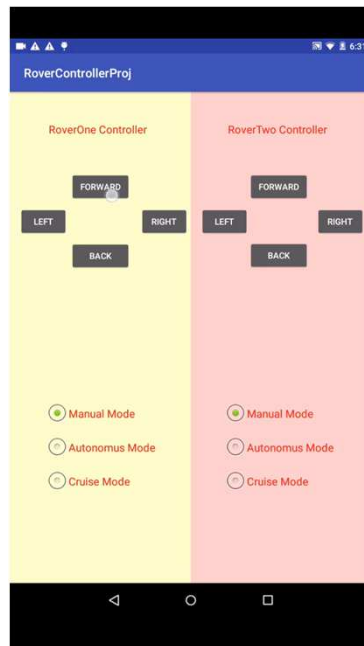

Manual Mode

Autonomous  
Mode

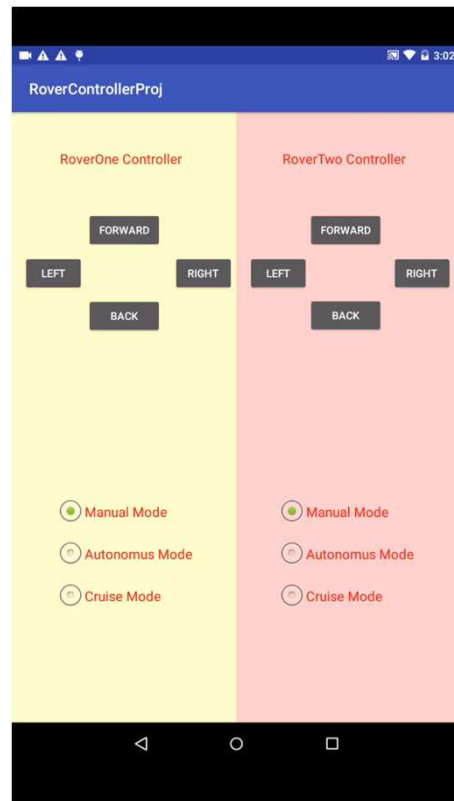

Cruise Mode

## Use Case 1: Manual Mode

## Use Case 2: Autonomous/Cruise Mode

## Future Work

- Creating complex control software use case scenarios:
  - Establishing communication among a group of rovers for autonomous exploration.
  - Autonomous Rover with camera and GPS for navigation.
